

The Baltic Sea in Transition, 11 June 2018

# Regional and Global Earth System Modelling Activities in MERGE

**Paul A. Miller**

(With thanks to Ben Smith and many MERGE colleagues)

Dept. of Physical Geography and Ecosystem Science  
Centre for Environmental & Climate Research (CEC)  
Lund University, Sweden

**LUND**  
UNIVERSITY

**LUCCI**

Lund University Centre for Studies of  
Carbon Cycle and Climate Interactions

# Outline

- What is MERGE?
- Terrestrial ecosystems in the climate system
- LPJ-GUESS – a state-of-the-art DGVM
- Modelling vegetation feedbacks to climate with RCA-GUESS
- The EC-Earth ESM and plans for CMIP6
- Outlook

# Modelling the Regional and Global Earth System

**MERGE**

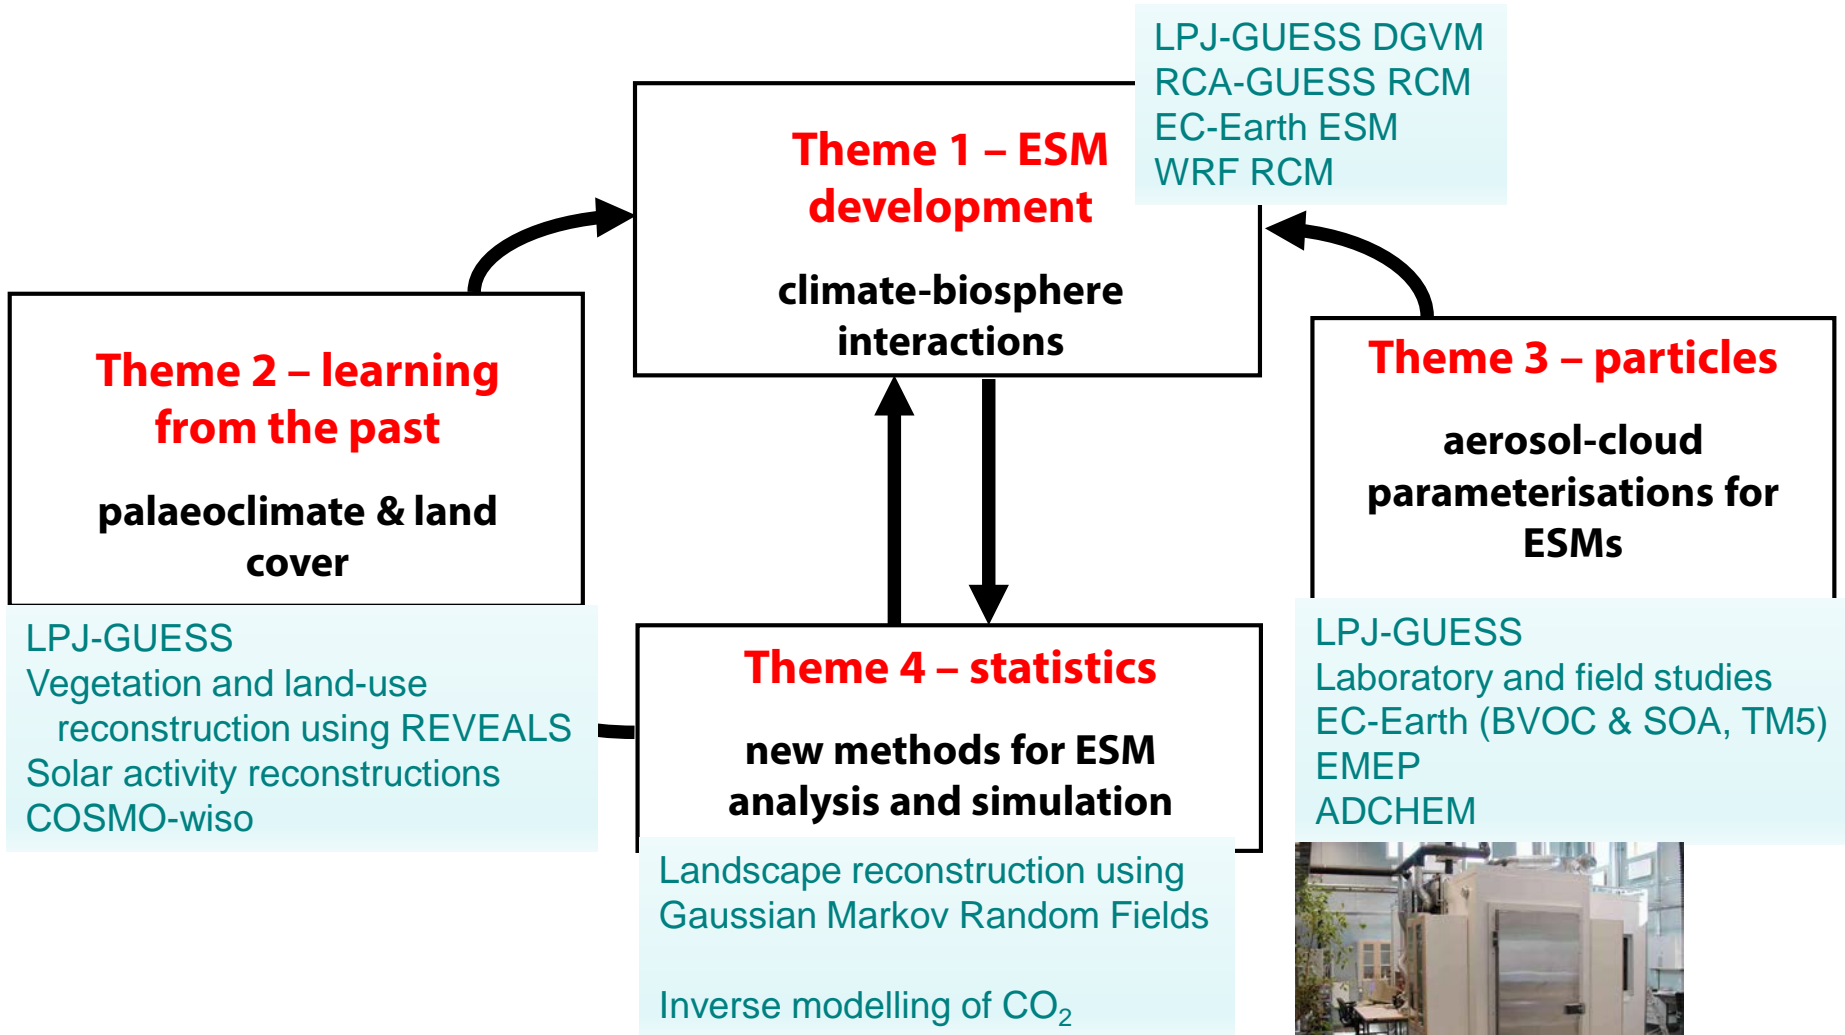

- Strategic research area (SRA) =
  - Result of a Swedish government-initiated call for proposals in 2008.
  - Universities invited to compete for a share of 1.8 billion SEK to establish SRAs on 24 topics for a 5-year trial period (2010-14)
  - increase in central university funding in exchange for a commitment by the university to pursue and develop research in a particular area of strategic (applied) importance for Sweden
  - network of researchers at one or a number of universities, research institutes, faculties, departments and research groups linked by collaboration or common focus on one or a number of related topics or themes
- Modelling the Regional and Global Earth System (MERGE) was one of two successful proposals on the topic "Climate models"
- The SRAs will be evaluated in 2019/20 with a view to being made permanent from 2020

- To advance the state-of-the-art for representing biosphere-atmosphere forcing and feedbacks in global and regional Earth system (climate) models
- To contribute to national and international efforts to describe and attribute climate change, underpinning policy responses
- To educate a new generation of young ESM model experts
- To support the ClimBEco graduate school - [www.climbeco.lu.se](http://www.climbeco.lu.se)
- To improve the societal relevance of climate models and their results

# Addressing the Research Challenges

## The Four Linked Research Themes

# Energy budget of the Earth

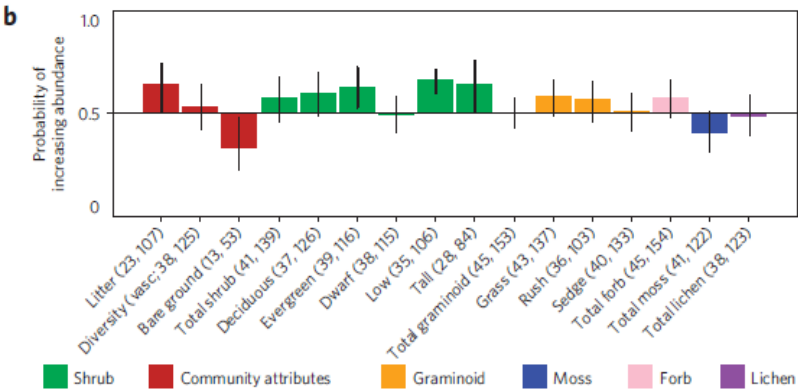

Global average point fluxes ( $\text{Wm}^{-2}$ )

# Tundra ecosystems are changing

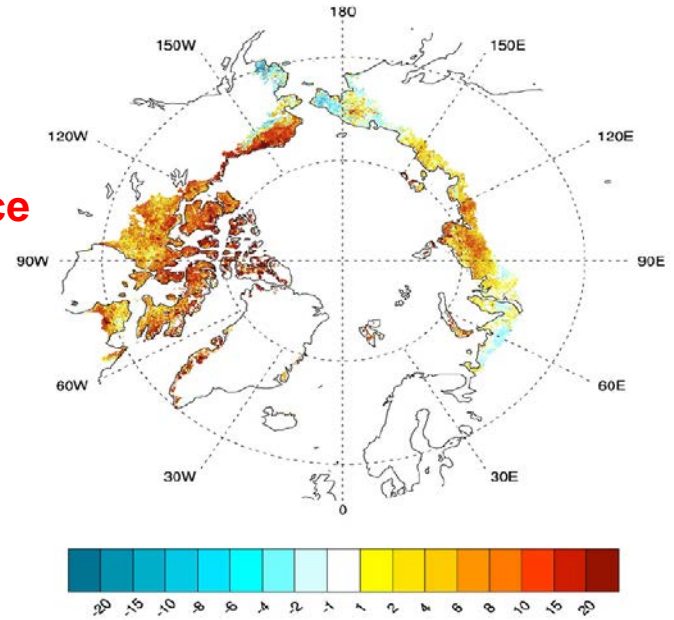

**Canopy Height**

**Abundance**

■ Shrub   
 ■ Community attributes   
 ■ Graminoid   
 ■ Moss   
 ■ Forb   
 ■ Lichen

**c** Maximum NDVI (MaxNDVI) (percentage change, 1982-2008) **~Biomass**

Bhatt et al., 2010

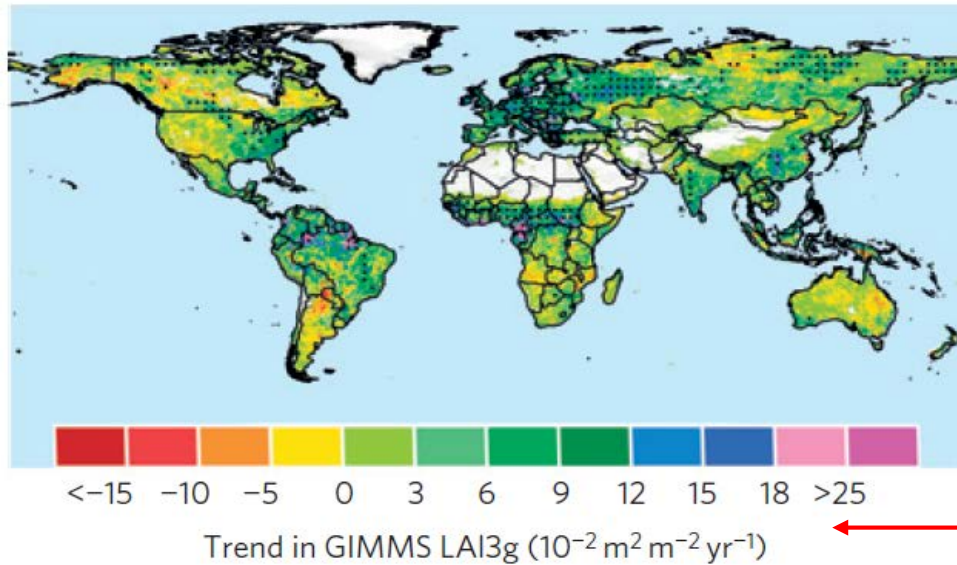

Plot-scale analysis by Elmendorf et al., NCC, 2012

**Shrub Expansion**

Sturm et al., 2005

# Vegetation cover and productivity have increased in concert with recent decades' climate warming and CO<sub>2</sub> increases

- Trend attribution from models:
- CO<sub>2</sub> fertilization (increased NPP)
  - Climate change
  - Nitrogen deposition
  - Land cover change

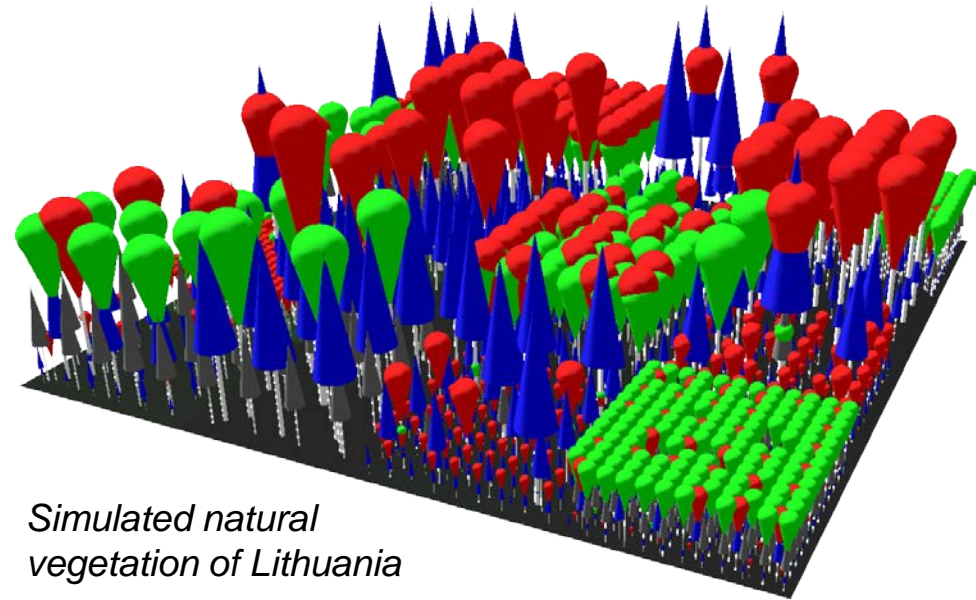

**Change in land surface greenness  
1982-2009**

Recent greening trends have mitigated background climate warming, mainly due to increased evapotranspiration

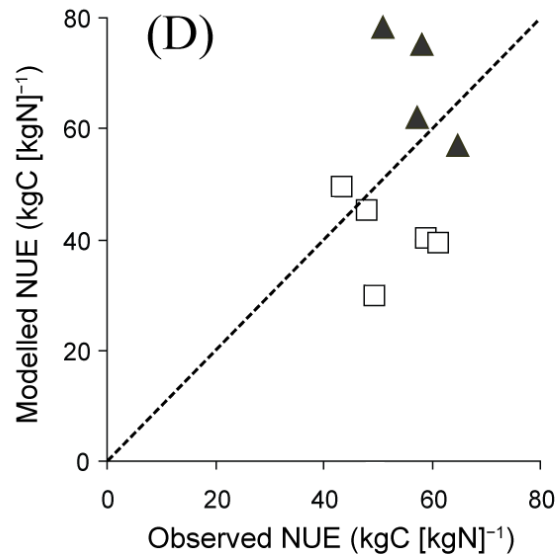

# LPJ-GUESS – global DGVM & ecosystem model\*

\*Smith et al. 2001, 2014

# Forest stand structure, productivity, N cycling\*

- CANIF forest sites:
- broadleaf
  - ▲ needleleaf
- Luysaert biomes:
- × boreal deciduous forest
  - + boreal evergreen forest
  - ◇ temperate/boreal mixed forest
  - temperate deciduous forest
  - temperate broadleaved evergreen
  - △ temperate mixed forest
  - ◆ tropical rainforest
  - tropical deciduous forest
  - ▲ moist savannah
  - ▼ dry grassland

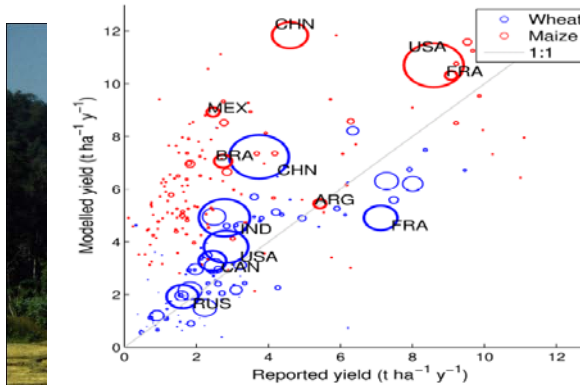

# Managed land version accounts for land use\*

Daily grazing

Yearly cutting

PASTURE

Crop rotations

Cover crop

Irrigation

CROPLAND

N limitation  
Land cover/land use change (gross vs. net)

Succession of abandoned farmland

NATURAL

MGD. FOREST

Continuous forestry

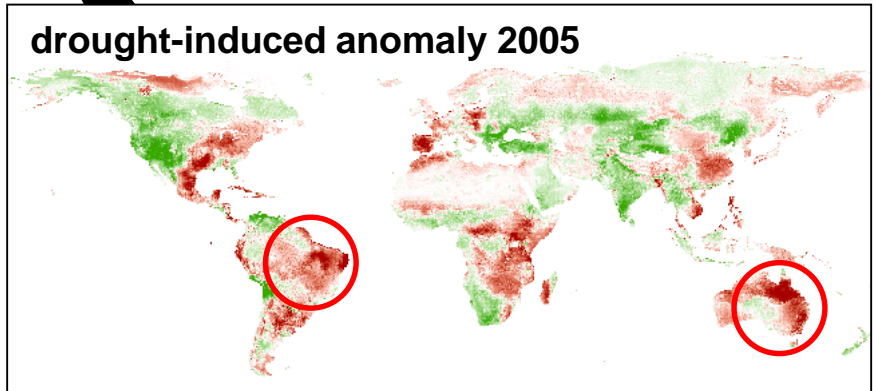

Detailed forest management

# Comprehensive Stordalen Catchment C Budget, 1913-2100

Source: Tang, Miller *et al.*, Biogeosciences (2015)

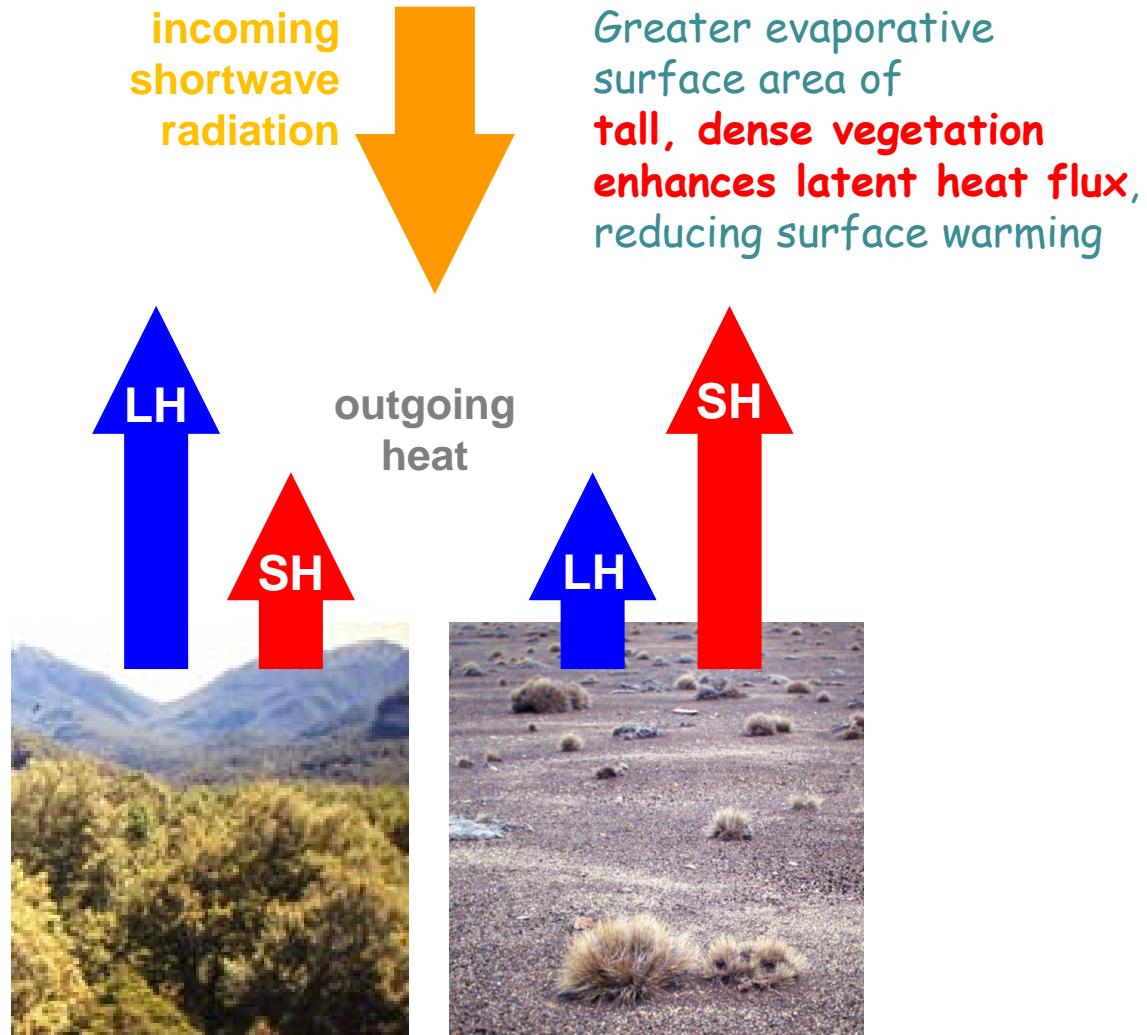

# Vegetation dynamics resulting from climate change

# But! Offline studies miss feedbacks to climate via changed land-atmosphere energy balance

**Albedo** (reflected sunlight) **differs between forest and open land**, especially during period of **snow lie**

# RCA-GUESS: a regional Earth system model\*

open loop for biogeochemical feedback

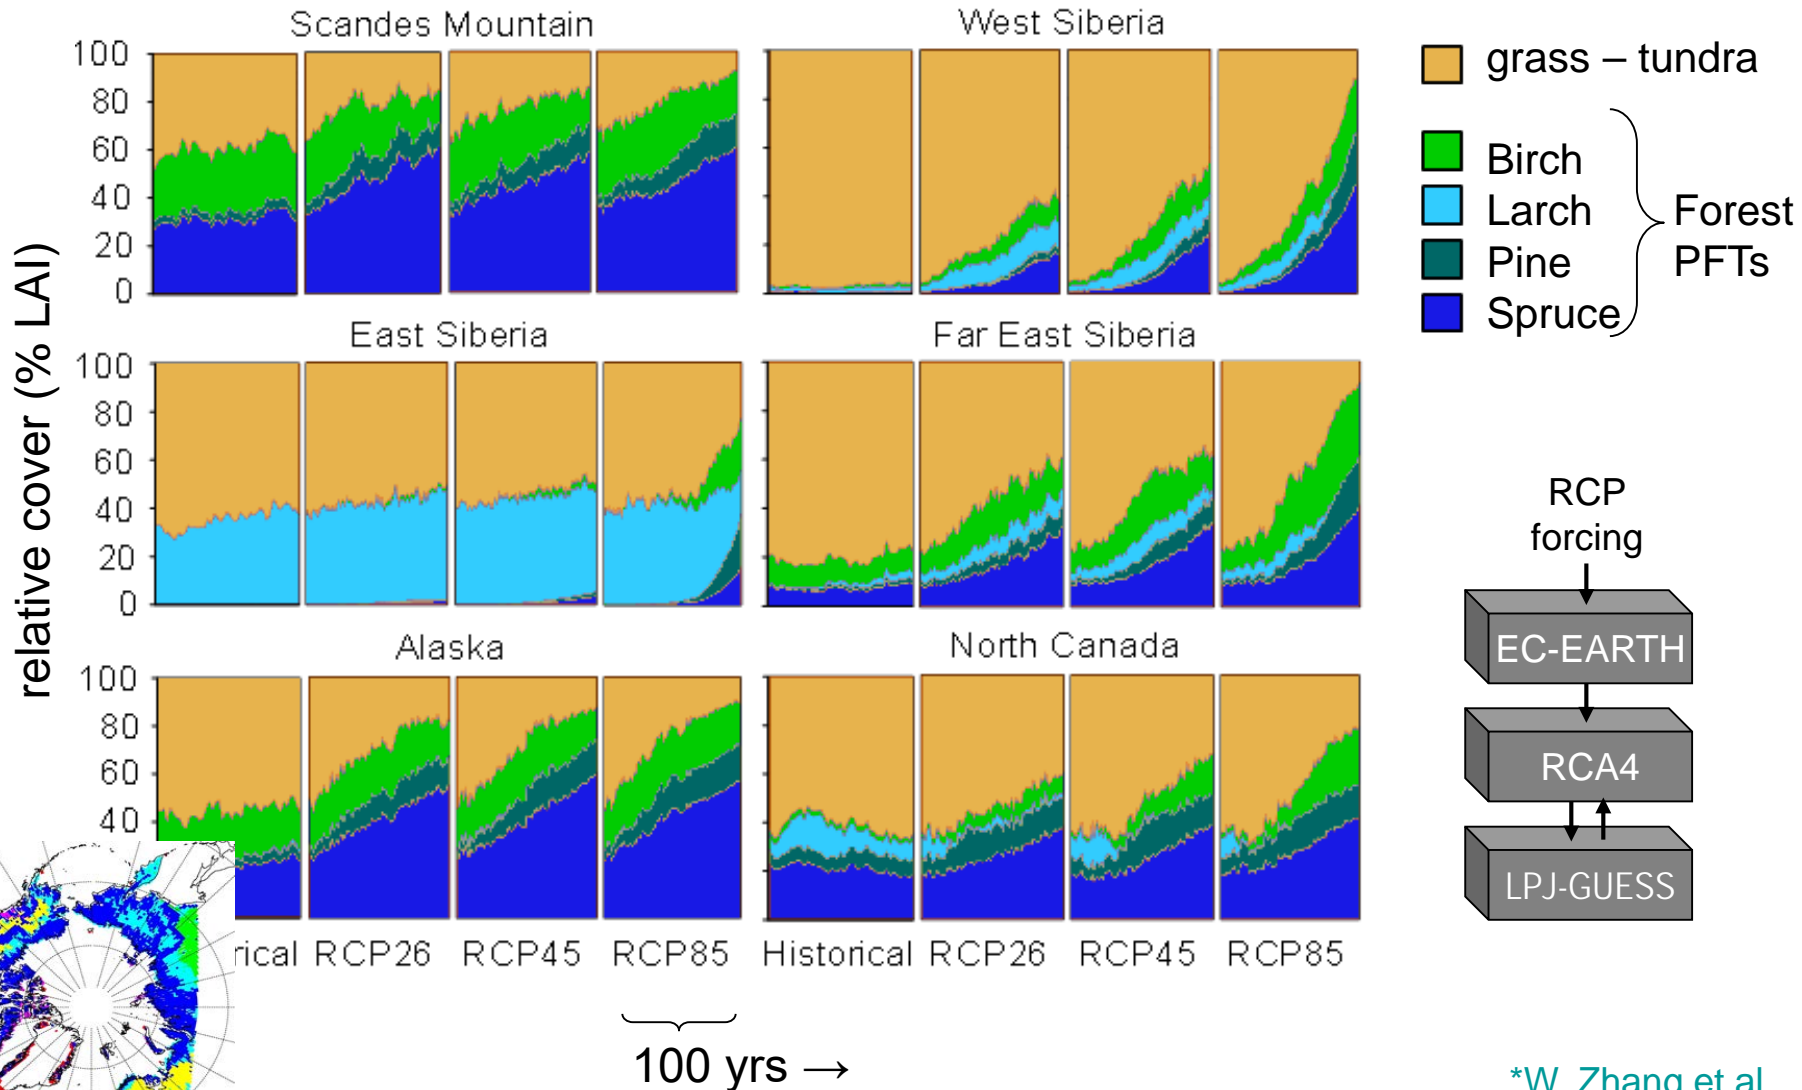

\*Smith et al. 2011  
Tellus 63A: 87-106

+ Multiple published studies for CORDEX Europe, Africa, Arctic, S. America

# CORDEX-Arctic domain vegetation present and future\*

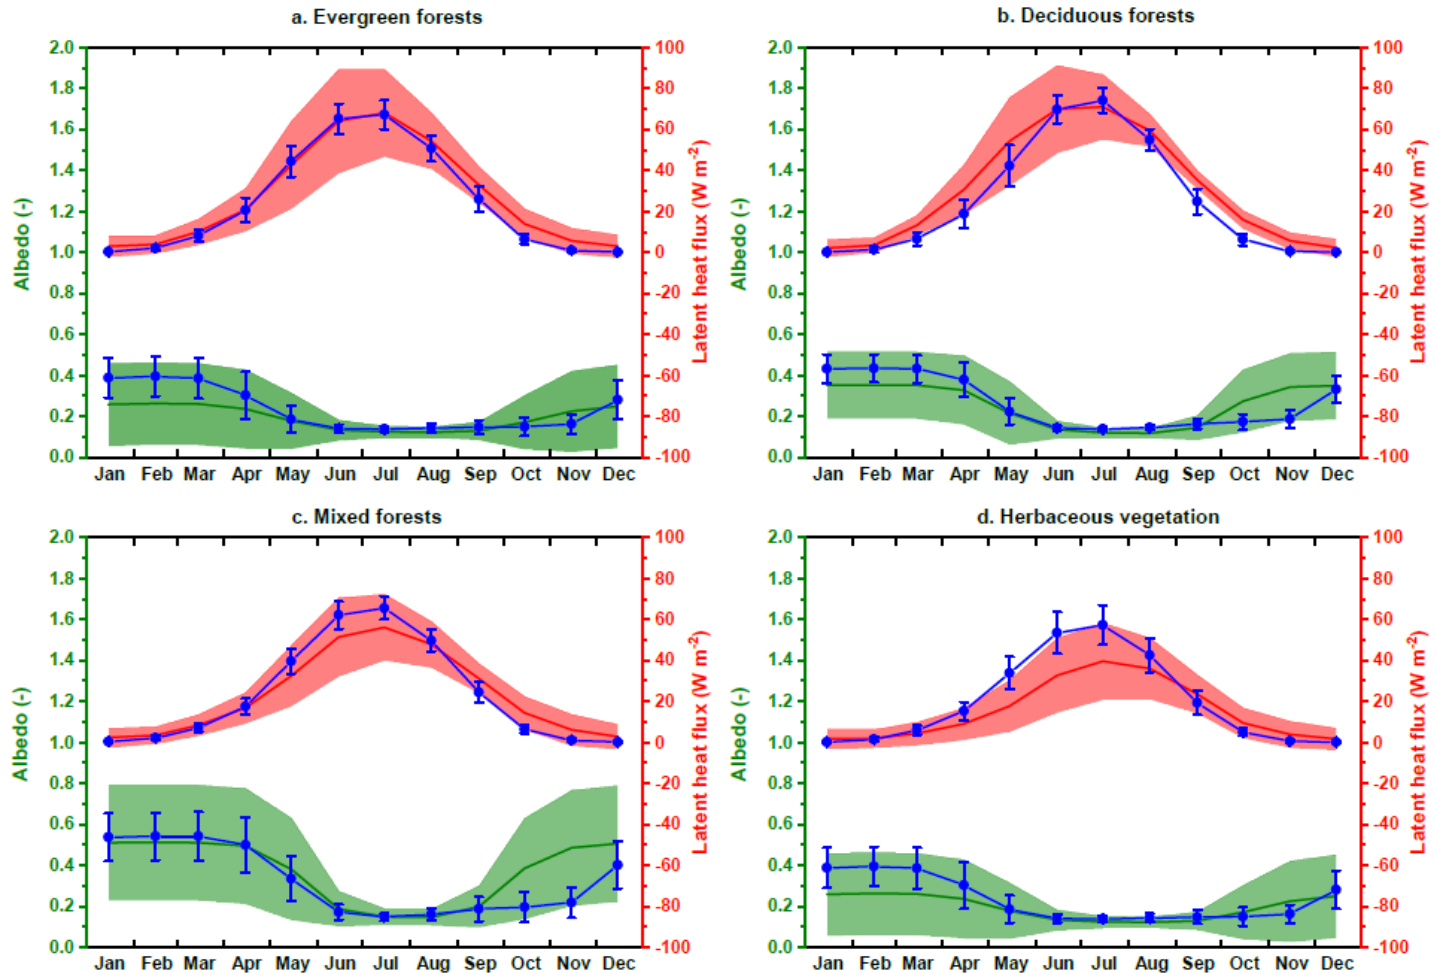

coupled simulation (veg biophysical feedbacks included)

\*W. Zhang et al. in revision.

# RCA-GUESS evaluation\*

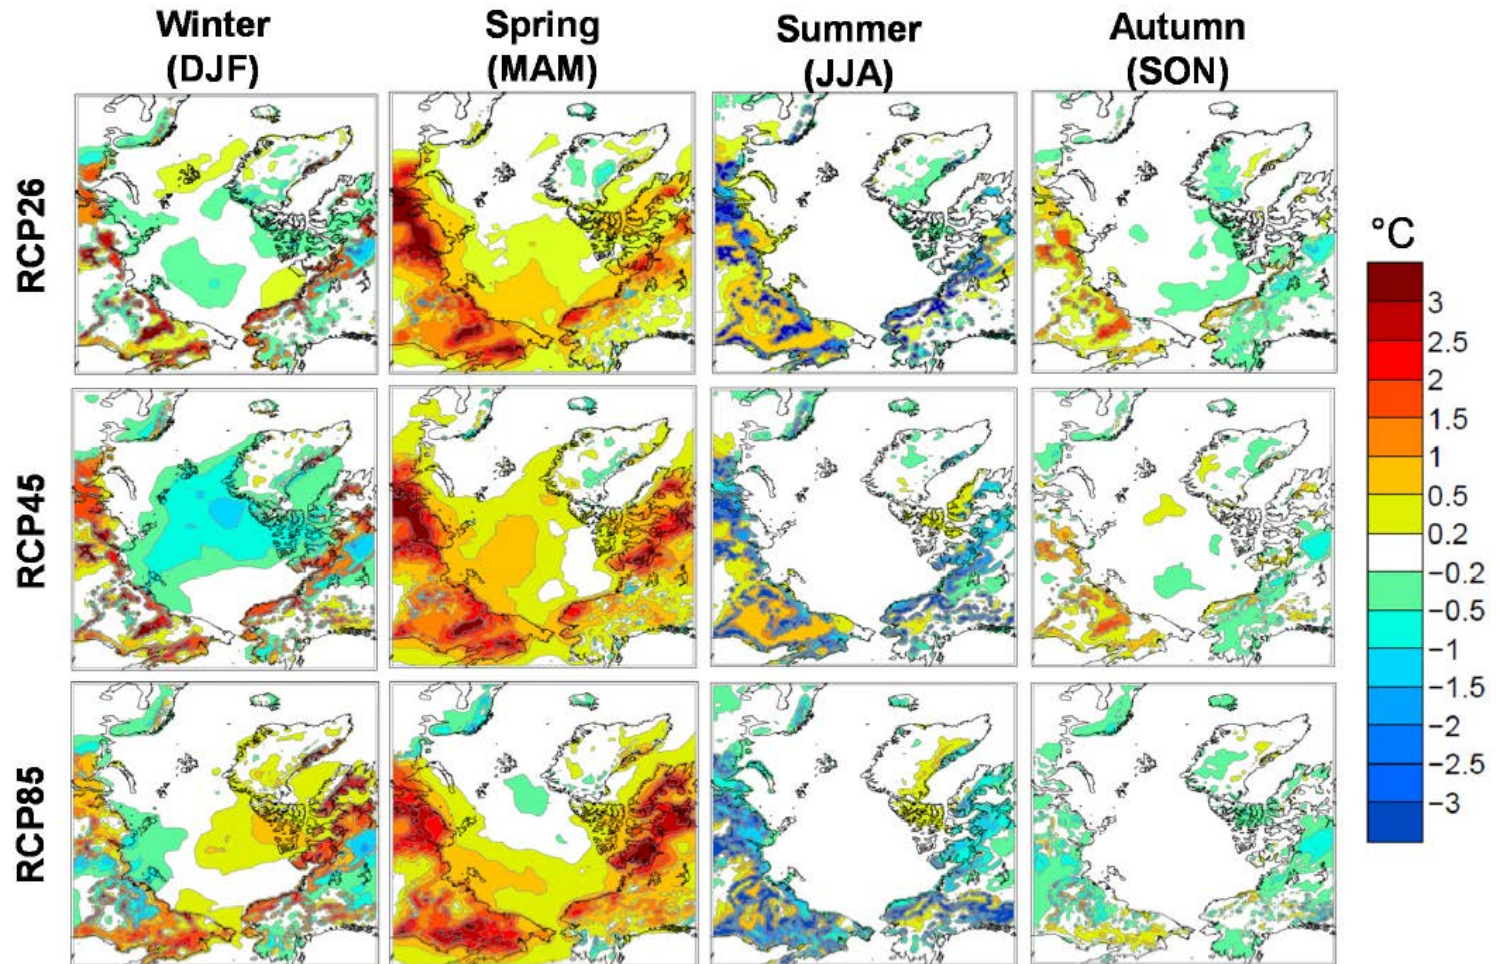

## Evaluation of Albedo (Globalbedo) and Latent Heat Flux (upscaled FLUXNET) by Vegetation Type

\*W. Zhang et al.  
in revision

# Feedbacks to surface air temperature\*

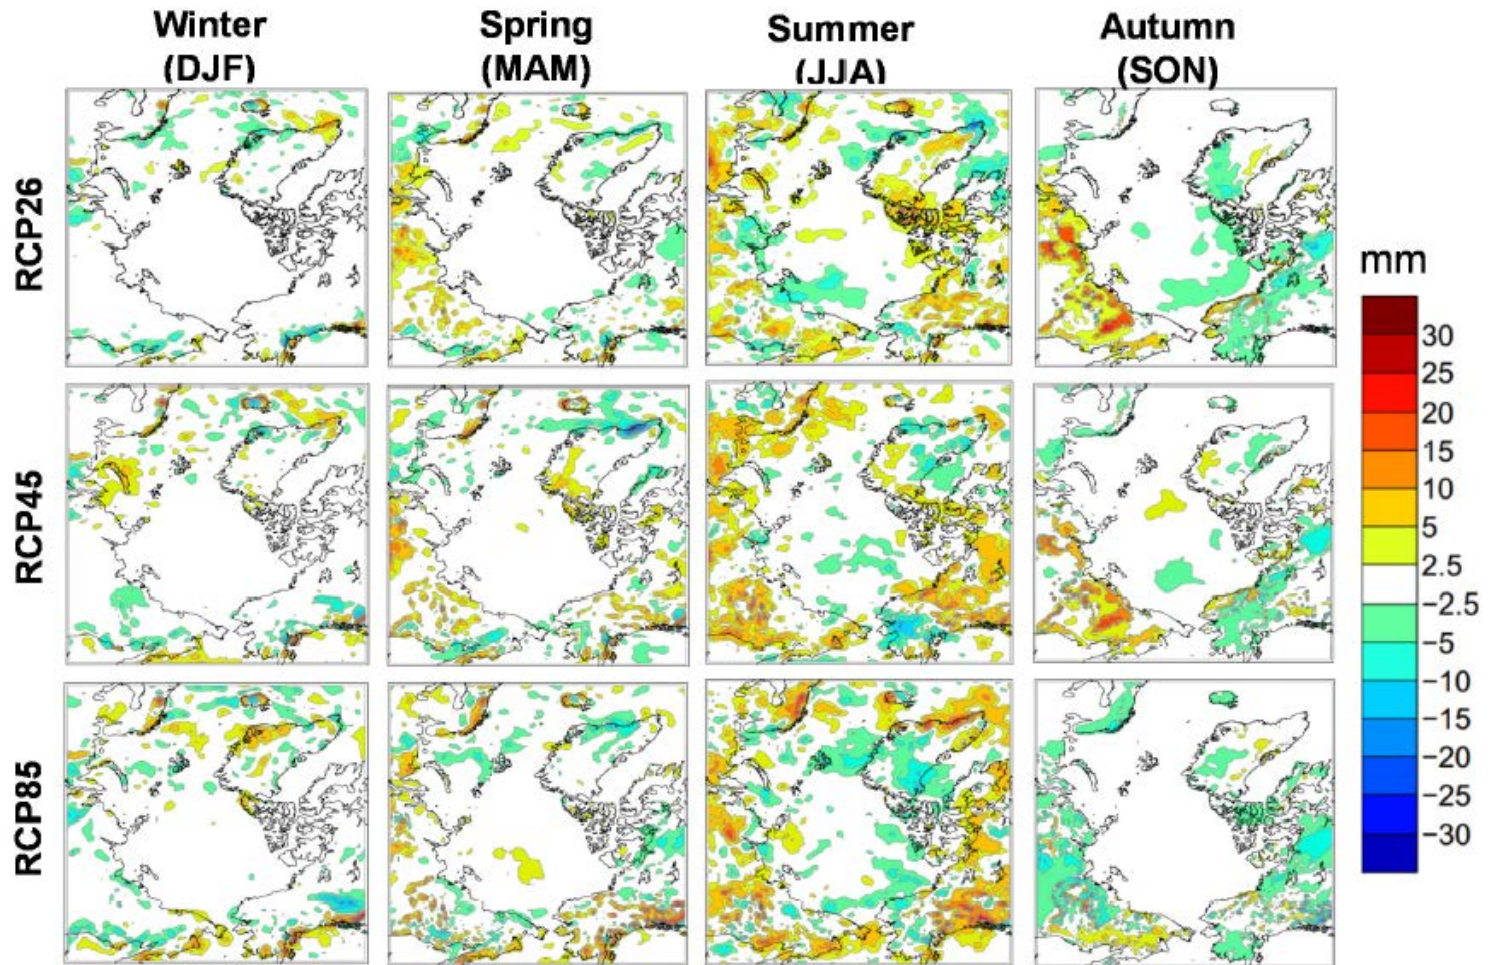

Additional temperature change due to vegetation feedback  
(2071-2100)–(1961-1990)

\*W. Zhang et al.  
In revision.

# Feedbacks to precipitation\*

Additional precipitation change due to vegetation feedback  
(2071-2100)–(1961-1990)

\*W. Zhang et al.  
in revision

# Arctic vegetation feedbacks show the potential for dynamic vegetation change to alter regional climate

- Seasonality shift – longer growing season, earlier temperature peak
- Evaporative cooling evens out growing season temperature profile
  - favours further shrub encroachment and treeline advance
  - Enhances the terrestrial C sink (Zhang et al. 2014)

\*W. Zhang et al.  
in revision.

# CMIP6 – Scientific Context and Research Questions

## WCRP Grand Challenges

- Clouds, Circulation and Climate Sensitivity
  - Changes in Cryosphere
  - Climate Extremes
  - Regional Climate Information
  - Regional Sea-level Rise
  - Water Availability
- and
- Biogeochemical forcings and feedbacks

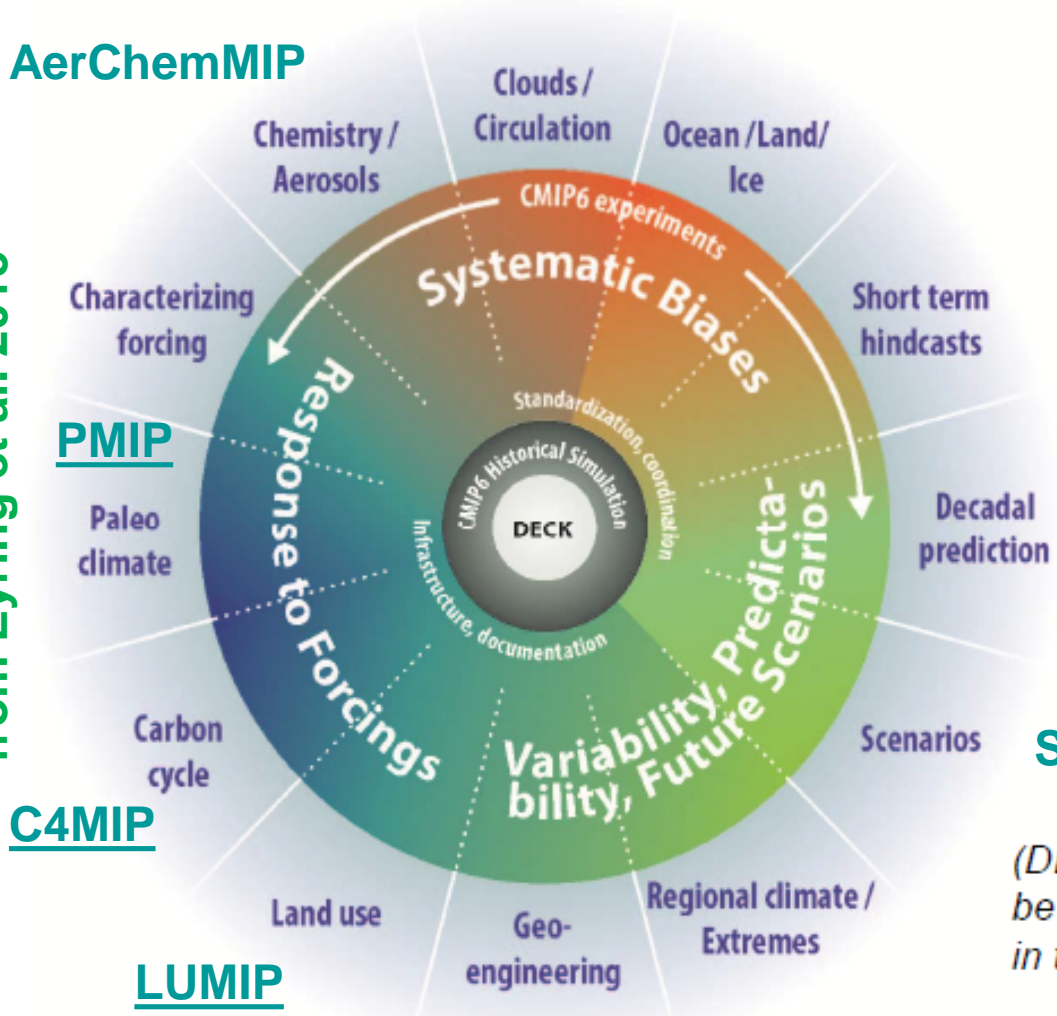

CMIP6 experimental design will address:

1. How does the Earth System respond to forcing?
2. What are the origins and consequences of systematic model biases?
3. How can we assess future climate changes given climate variability, predictability and uncertainties in scenarios?

# CMIP6 DECK & Model IntercomParisons (MIPs)

from Eyring et al. 2015

## DECK (entry card for CMIP)

- i. AMIP simulation (~1979-2014)
- ii. Pre-industrial control simulation
- iii. 1%/yr CO<sub>2</sub> increase
- iv. Abrupt 4xCO<sub>2</sub> run

## CMIP6 Historical Simulation (entry card for CMIP6)

- v. Historical simulation using CMIP6 forcings (1850-2014)

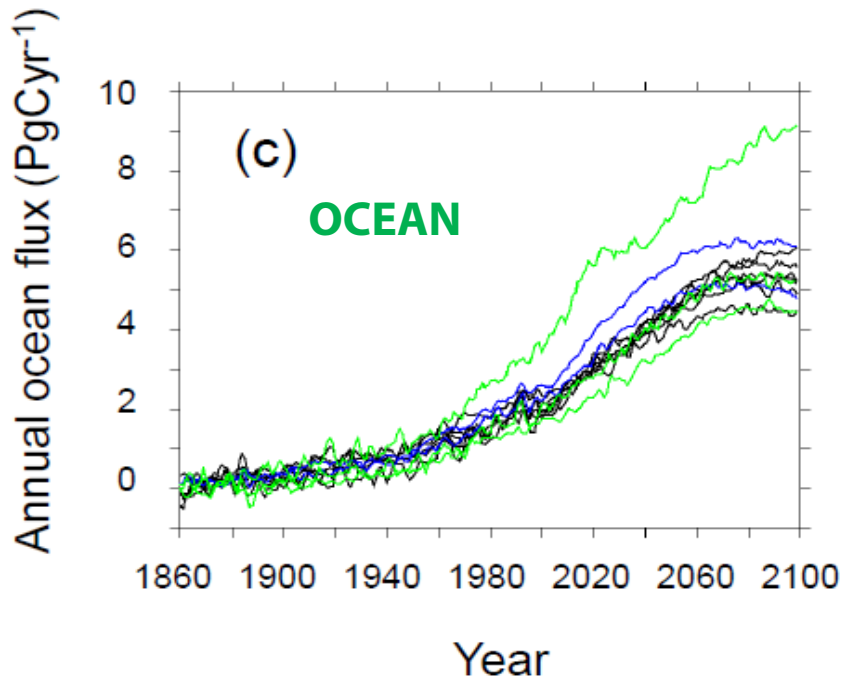

## ScenarioMIP

*(DECK & CMIP6 Historical Simulation to be run for each model configuration used in the subsequent CMIP6-Endorsed MIPs)*

**CMIP6 Historical Simulation will serve as a benchmark for CMIP6-endorsed MIPs**

# Terrestrial carbon cycle fluxes differ widely in 11 carbon-climate CMIP5 ESMs (RCP 8.5 CO<sub>2</sub> emissions)

**LUC emissions prescribed**  
**LUC emissions calculated**  
**Interactive C-N dynamics**

Friedlingstein et al. 2014  
*J. Climate*

- Land Use Change (**LUC**) emissions were treated differently in the models
- Some AR5 models had [dynamic vegetation](#)
- Some AR5 models had [nutrient \(N\) limitations on plant growth](#)
- No AR5 model included dynamic vegetation AND C-N interactions

# There is a large spread in the modelled terrestrial ecosystem C pools in IPCC-AR5 carbon-climate ESMs

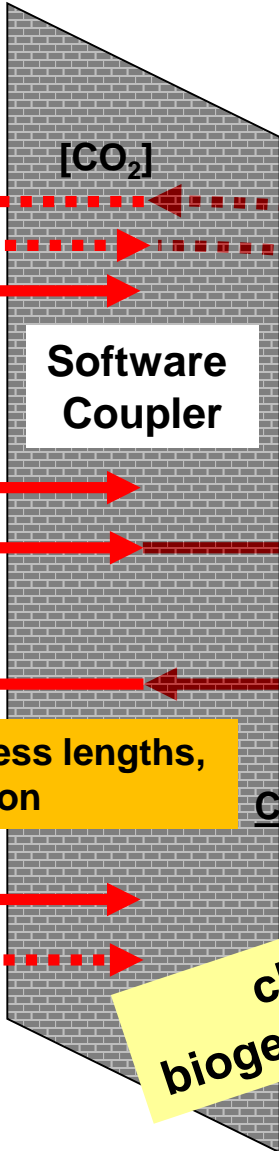

- The large spread in ESM soil C is due to differences in NPP and parameterisation of heterotrophic respiration response to soil water and temperature
- CMIP5 ESMs generally overestimate CO2 fertilization

# EC EARTH<sub>3</sub> C-enabled ES<sub>M</sub> in CMIP6

Closed loop for biogeochemical feedbacks

External Forcing & Boundary Conditions:  
Land use  
CO<sub>2</sub> emissions  
N deposition

TM5  
(chemistry, transport)

LAI, high & low vegetation

tile fraction & types  
Crops and pasture

Update Albedo, roughness lengths, root distribution

runoff

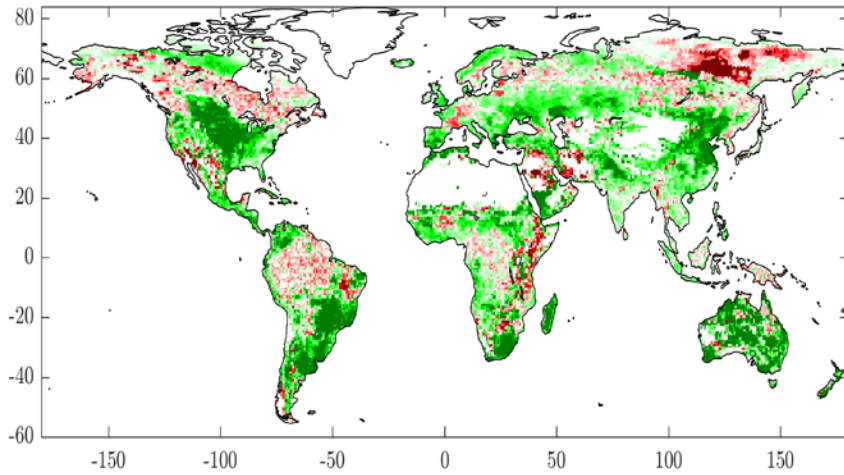

NEMO/PISCES /LIM3  
(ocean, sea ice, BGC)

closed loop for biogeophysical feedback

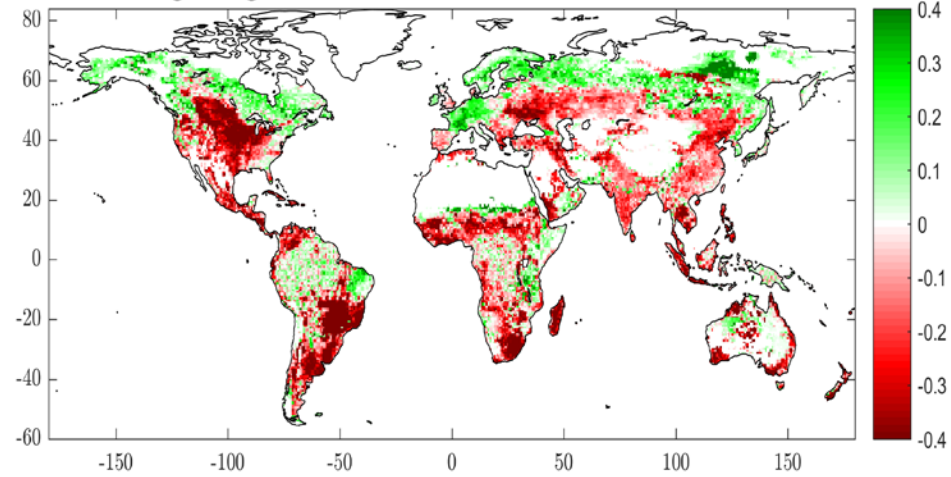

# Dynamic Vegetation in EC-Earth, 1870-2010

Low Vegetation Fraction - Difference 2010-1870

High Vegetation Fraction - Difference 2010-1870

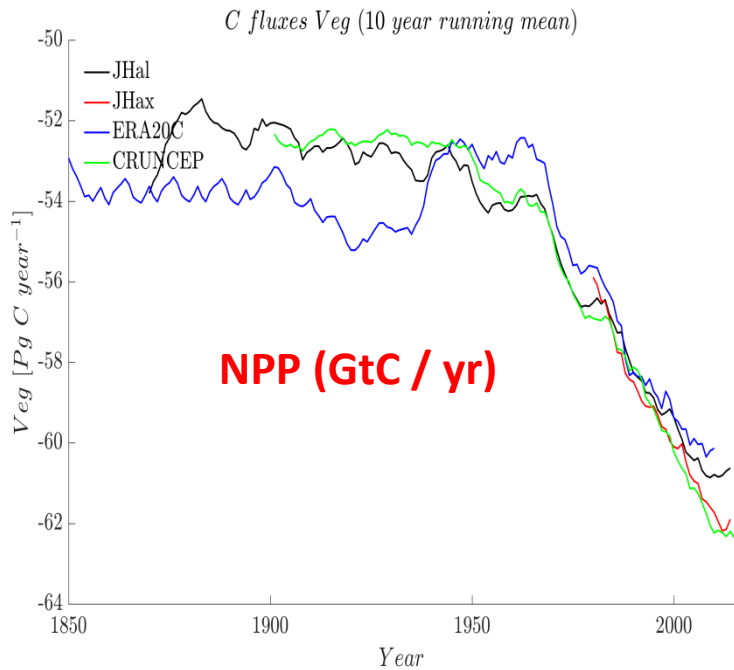

# Evaluation – terrestrial C pools and fluxes

LPJ-GUESS – IFS

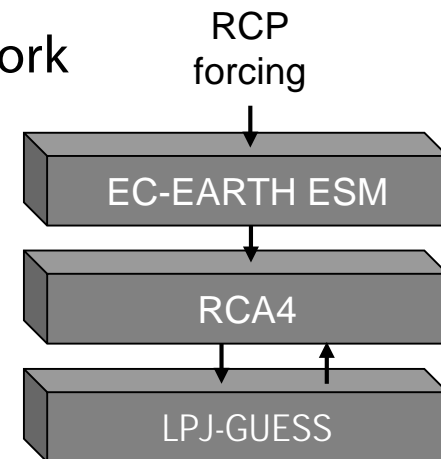

Fully coupled simulation 1870-2015

D. Wårlind & L. Nieradzick  
(Lund Univ.)

# CMIP6 and EC-Earth

- Final tuning ongoing
- DECK experiments due to begin this month
- Systematic and comprehensive ESM evaluation. E.g. using **ESMValTool** with CMIP6 models
- Even EC-Earth runs without LPJ-GUESS coupled will use LPJ-GUESS vegetation fields, ensuring consistency across GCM and ESM experiments
- Multiple model configurations and MIP commitments make this a huge technical and scientific challenge!
- Dynamical downscaling will use a consistent ESM framework

# Outlook and further model improvements

- Field studies, observations and modelling highlight the importance of including detailed biosphere-atmosphere interactions in coupled modelling frameworks
- But a modeller's work is never done! We need to include
  - Permafrost-C interactions and wetland CH<sub>4</sub> emissions
  - Phosphorous limitation in addition to N important in the tropics
- Improved wildfire parameterizations with BLAZE
- New ecosystem disturbances such as insect attacks
- Plant functional types (PFTs) must be added that can better quantify the potential for bioenergy carbon capture and storage (BECCS) to mitigate climate change
- Etc.
- LPJ-GUESS developments will be available to RCA-GUESS and EC-Earth, providing better projections and for the Baltic Sea region

Closed loop for biogeochemical feedbacks

External Forcing & Boundary Conditions:  
Land use  
CO<sub>2</sub> emissions
