Seasonal variation is prominent !

Field data

Both quantity and quality of food are of critical importance!

A Macrobenthos-TOC model

Parallel ecological networks in ecosystems

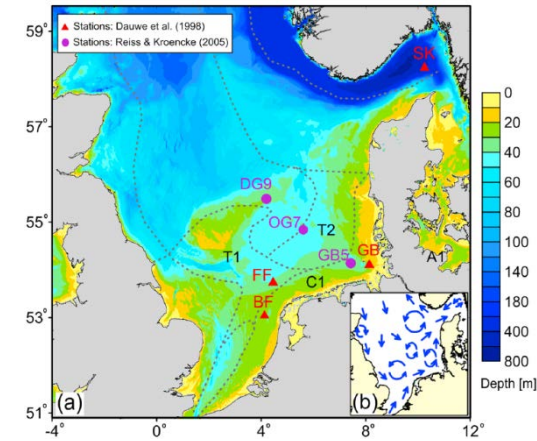

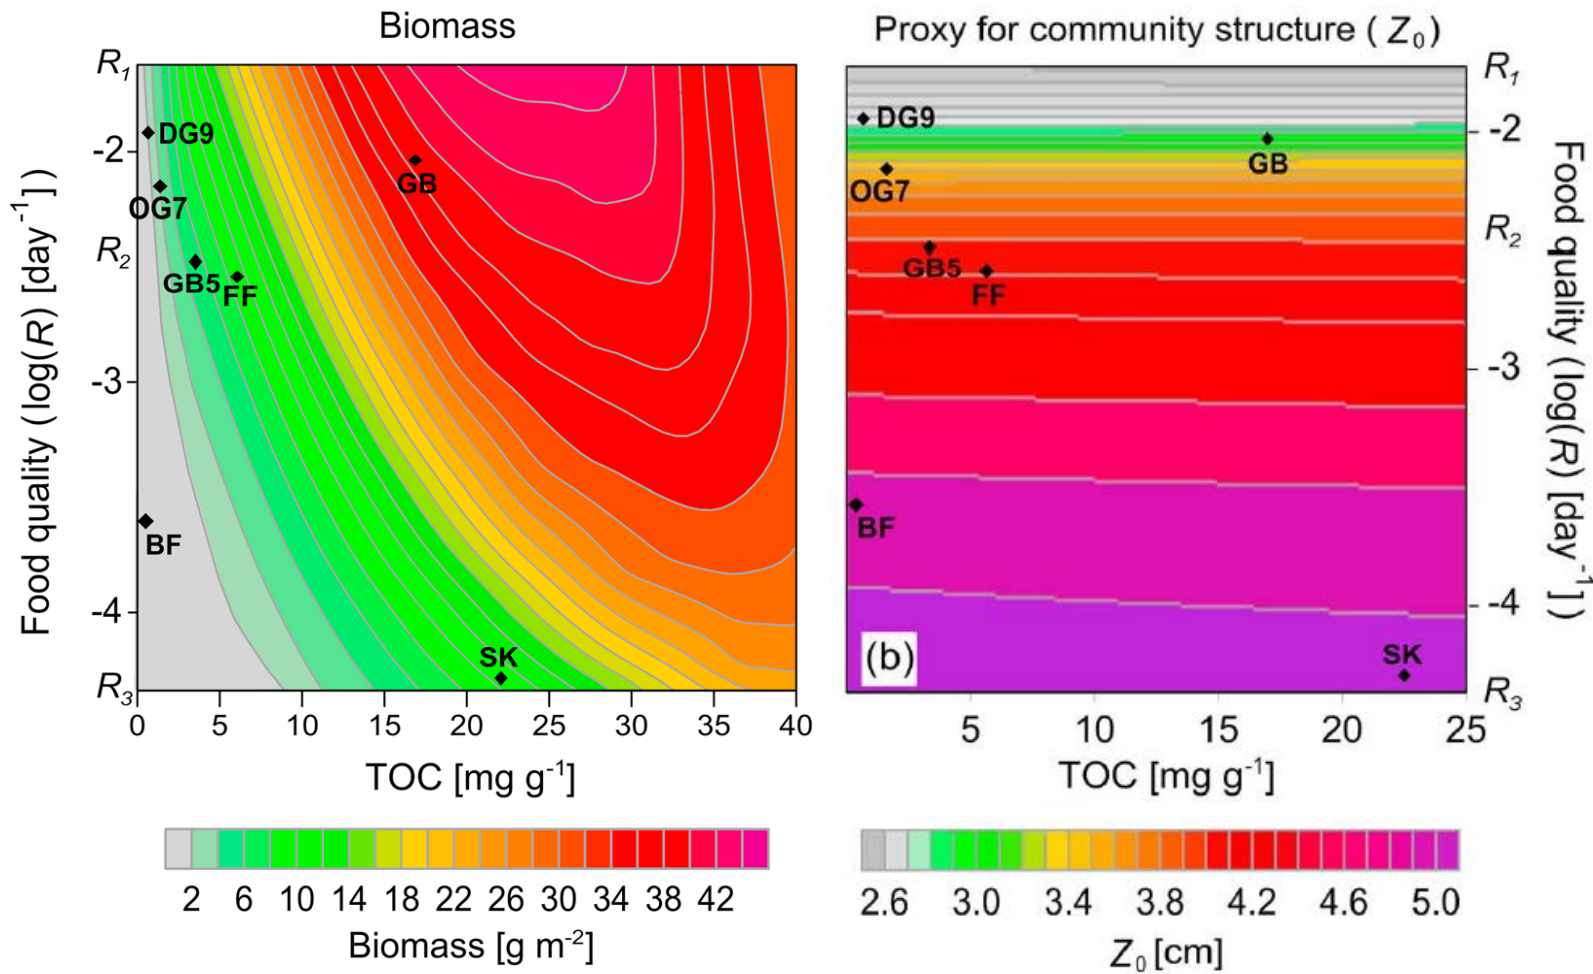

- Consumer–resource interactions
- Interactions of organisms with abiotic (non-resource) conditions
- Spatial interactions (flux of energy, material and organisms)
- Non-trophic direct interactions among organisms
- Physical and chemical interactions
- External forcing of abiotic conditions

Olf et al., 2009

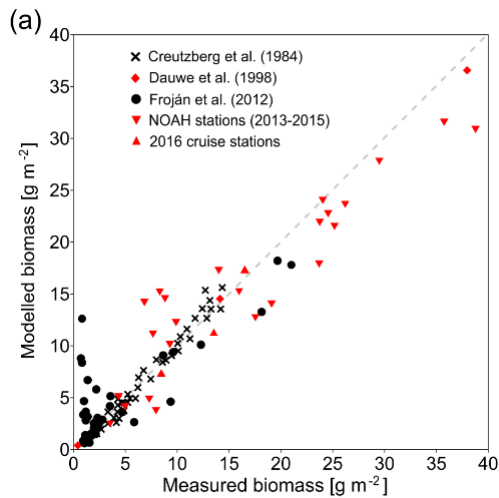

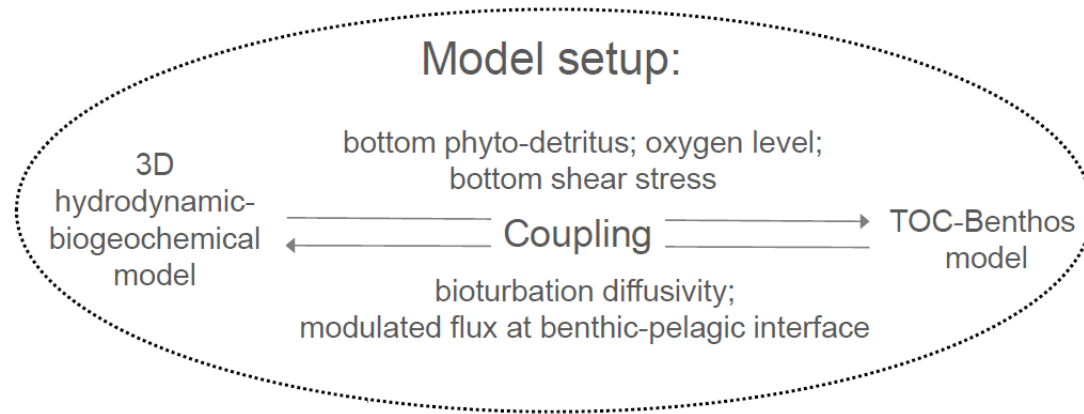

$$(1 - p) \frac{\partial C_i}{\partial t} = - \frac{\partial w(1 - p)C_i}{\partial z} + \frac{\partial}{\partial z} \left(K_v(1 - p) \frac{\partial C_i}{\partial z} \right) - (1 - p) \left(R_i + (1 - \varepsilon_i) \gamma \frac{B}{\rho_s} \right) C_i;$$

Model application to Baltic Sea

Model application to Baltic Sea

Summary – North Sea application

- Good agreement between field data and model results;
- Long-term (multi-year) variation of benthic biomass in shallow water (<20 m) is significantly influenced by climate drivers (e.g. NAO winter index);
- Macrobenthos in the regional scale (SNS) are more resilient to climate drivers, except for a prominent seasonal fluctuation;
- Macrobenthos annually reworked 30 – 50% of TOC in seafloor surface sediments;
- Macrobenthic uptake is larger than vertical transport in terms of reworked TOC budget at the interface;
- No net change in TOC budget in surface sediments.

Summary – Baltic Sea application

Summary – Baltic Sea application

- Good agreement between field data and model results;
- Long-term (multi-year) variation of benthic biomass in shallow water (<20 m) is significantly influenced by climate drivers (e.g. NAO winter index);
- Macrobenthos in the regional scale (BS) are heavily affected by hypoxia;
- Macrobenthos annually reworked 15 – 25% of TOC in seafloor surface sediments;
- Macrobenthic uptake is subordinate compared to vertical transport in terms of reworked TOC budget;
- Net increase in TOC budget in surface sediments.
