

First evaluation of a high resolution model for the Central Mediterranean Sea

Ali Harzallah¹, Avichal Mehra² and Wassila Thiaw³

¹ National Institute of Marine Sciences and Technologies (INSTM), Salammbô, Tunisia
(ali.harzallah@instm.rnrt.nt)

² Environmental Modeling Center (EMC), National Oceanic and Atmospheric Administration, Maryland, USA

³ Climate Prediction Center (CPC), National Oceanic and Atmospheric Administration, Maryland, USA

- Supported by NSF-PEER project (PARTNERSHIPS FOR ENHANCED ENGAGEMENT IN RESEARCH)
- MedCORDEX2 FPS : Role of the air-sea coupling and small-scale ocean processes on regional climate

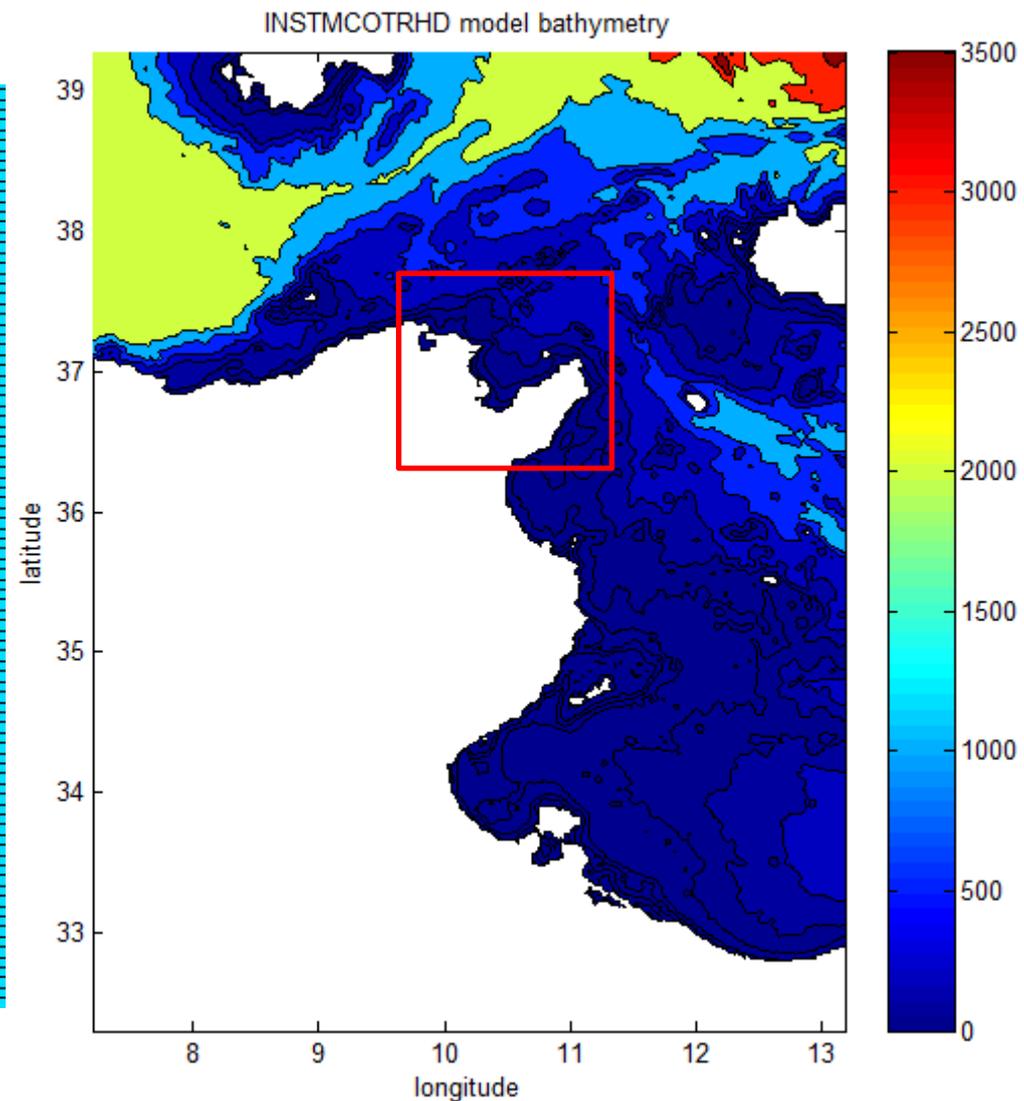

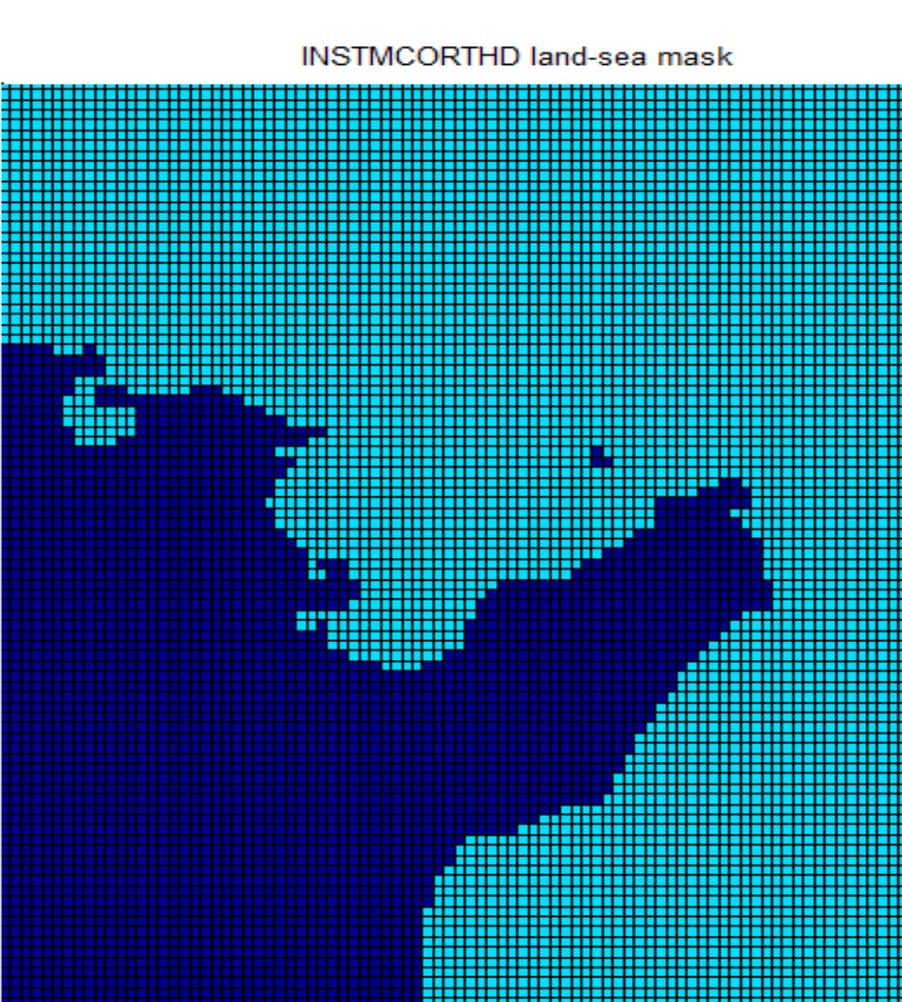

The objective: Set-up a high resolution model for the Central Mediterranean:

- . Provide multi-targeted high resolution maps of T,S,UV (application: e.g. sea energy)
- . Study fine scale structures generated
- . Compare different forcing fields (CMEMS vs RTOFS; ERA-Interim vs GFS/CFS)
- . Include tides, waves, ...

The Model: INSTMCOTRHD

INSTMCOTRHD (POM): ~2 Km (1/52°) 28 VL Inter. surf. flux. (6 hourly); Lateral daily

Bathymetry : Global Multi-Resolution Topography (GMRT, Ryan et al, 2009).

for ocean energy application

CONCLUSION

- A High resolution model for the Central Mediterranean has been set up
- Two different ocean forcing reanalysis sources were used : RTOFS and MED16
- A first simulation : the year 2014.
- Different behaviours were found: weaker Atlantic Current in MED16
- Shallow areas are better simulated in the INSTM model (Gulf of Gabès)

NEXT:

- Use two atmospheric forcing : ERAInterim/ERA5 and GFS/CFS
- Add tides and waves
- 10-year simulation : 2008-2017.

EVALUATION OF OCEAN SYNTHESSES

COST Action ES1402

<http://www.eos-cost.eu>

A COST Action to **improve the coordination** of European efforts

in the evaluation of ocean syntheses:

- better understanding of the value and use of ocean syntheses
- promote the use of ocean syntheses
